

Prompt for LLM-based Evaluation

You are an experienced software developer. I will provide you with a function code snippet and 11 candidate function names. Do not skip any of them. Make sure to return exactly 11 evaluations. Your task is to evaluate each function name based on the code snippet and the following two criteria (C):

****C1. Accuracy Score (1–5): ****

Rate how well the function name reflects the functionality of the provided code snippet. Use a scale from 1 to 5, where a higher score indicates more accuracy. 1 means completely irrelevant or misleading, and 5 means perfectly aligned and clearly expresses the function's functionality. Note that an accurate function name should adhere to the following coding conventions:

- (1) Clearly convey the primary purpose of the function and accurately reflect its core functionality;
- (2) Be concise yet descriptive, avoiding unnecessary words or redundancy;
- (3) Avoid using generic or ambiguous terms and ensure clarity and readability.

****C2. Naming Format Check (1 or 0): ****

'Check whether the function name follows common naming conventions for the target programming language, such as camelCase for Java and snake_case for Python. Assign 1 for compliance, 0 for non-compliance.

Once your evaluation is complete, present the 11 results and explanations for each function name in the following format:

****Function Name 0: <function name>****

C1: <1 - 5>. <Detailed Explanations>

C2: <1 or 0> (compliance and non-compliance with naming conventions, respectively). <Detailed Explanations>

.....

****Function Name 10: <function name>****

C1: <1 - 5>. <Detailed Explanations>

C2: <1 or 0> (compliance and non-compliance with naming conventions, respectively). <Detailed Explanations>

The following is a code snippet and 11 candidate function names under evaluation:

The code snippet:

The 11 function names under evaluation:

<function name 0>

.....

<function name 10>
