

Generated Summary

<source code>

Given the function code, write ONE concise comment sentence (for method-name generation) that describes what the function does for its caller, stating its main action, the main object it operates on, and the main result or effect, and keeping key domain terms. Avoid low-level implementation details, avoid generic verbs like “do/execute” or starting with just “return(s)”, and do not use “create” unless it truly creates a new externally visible entity. Output only a single-line comment starting with the appropriate comment marker.
